Attn: Mr. Takashi Chiyoda, General Manager

**Subject: Roof Tech RT-[E] Mount Gen II rail-less – Structural Analysis**

SML Job No.: 471-13

Dear Mr. Chiyoda:

We have analyzed the Roof Tech RT-[E] Mount Gen II rail-less photovoltaic (PV) panel roof mount system and determined that, for the configurations and criteria described below, it is in compliance with the applicable sections of the following Reference Documents:

- Codes: ASCE/SEI 7-10 Min. Design Loads for Buildings & Other Structures  
International Building Code 2012 & 2015 Editions  
International Residential Building Code 2012 & 2015 Editions
- Other: Aluminum Design Manual, 2010 & 2015 Editions

The Roof Tech RT-[E] Mount Gen II rail-less photovoltaic (PV) panel roof mount system is comprised of a 6000 series aluminum [E] Mount base, panel spacer, mid clamp, end clamp, and optional shims (up to 12-2mm shims). A stainless steel SS304 8.0 mm bolt and nut fastens the mounting system together, and the system is attached to the roof wood substrate with SS304 5.0 mm x 60 mm wood screws.

Three wood substrates were tested with the fasteners also passing through two layers of composite asphalt roof shingles and 2 layers of building paper. The first tested wood substrate consisted of 7/16" thick sheathing over a 2x4 DF #2 rafter (2x truss top chord OK by inspection), the second tested wood substrate consisted of 7/16" thick OSB only, and the third tested wood substrate consisted of 15/32" thick plywood only. See Exhibit 'A' – attached. Two wood screws are required at the rafter installations and four wood screws are required at the OSB and plywood only installations.

The testing data provided by Institute of Building Technology (IBT) report no.: 2426-17001-002 project no.: 28156 dated June 14, 2017, and report no.: 2426-17003 project no.: 28959 dated October 4, 2017 shows that the critical failure occurs in one of three ways; pullout of the wood screws from the OSB/Plywood only wood substrate, yielding of the attached components in shear, or ultimate failure of the aluminum [E] Mount. Maximum allowable values for these failure conditions were derived using a safety factor of 2.0 on the ultimate loads resulting in aluminum failure and a safety factor of 3.0 of the loads resulting in wood failure. The safety factor for downward compression on the sheathing is 2.0. The testing was performed in general accordance with IAPMO Uniform Evaluation Services *Evaluation Criteria for Joist Hangers and Miscellaneous Connectors*, EC002 adopted June 2007, revised January 2016 and ASTM D1761-2012, *Standard Test Methods for Mechanical Fasteners in Wood*.

Compression load capacity on the OSB and plywood installations were determined by calculations using the methods presented in the Panel Design Specification 2012 by The Engineered Wood Association (APA). This document provides the allowable moment for various wood sheathing materials including 7/16" thick OSB and 15/32" thick plywood. A simply supported beam analysis was used assuming the sheathing is supported on joists at 24" apart and that a 24" width of the sheathing is engaged. The results of this analysis are presented below.

**RT-[E] Mount PV Panel in Landscape Orientation:**

The maximum allowable uplift and shear force for 7/16" thick sheathing over a 2x4 DF #2 rafter is 586 lb and 304 lb respectively. The maximum allowable uplift, down force, and shear force for 7/16" thick OSB only is 141 lb, 258 lb, and 190 lb respectively. The maximum allowable uplift, down force, and shear force for 15/32" thick plywood only is 151 lb, 556 lb, and 217 lb respectively.

**RT-[E] Mount PV Panel in Portrait Orientation:**

The maximum allowable uplift, down force, and shear force for 7/16" thick OSB only is 119 lb, 258 lb, and 219 lb respectively. The maximum allowable uplift, down force, and shear force for 15/32" thick plywood only is 173 lb, 556 lb, and 263 lb respectively.

The attached tables below show the minimum number of mounts at each panel required for the combined loading criteria of wind speed, roof slope, and snow loads which produce reaction loads less than the allowable loads listed above. The effect of seismic loads (for all design categories A-F) have been determined to be less than the effect due to wind loads in all load conditions and combinations. The assumed topography is flat with a  $K_{zt} = 1.0$ . Therefore, the minimum allowable number of attachments for common load cases due to dead, wind and snow loads are the controlling load cases.

Table 0. Roof Angle to Roof Slope Conversion	
Roof Angle (Degrees)	Roof Slope (in/in)
0.0	0:12

40		4	4	4	6	6	6					
50		4	4	4	6	6	6					

Table Notes for Tables 1 to 6 – Tabulated values are based on the following criteria:

1. Building mean roof height = 30 ft maximum.
2. Risk Category = II.
3. Solar panel maximum area = 18.88 square feet (68 in. x 40 in.).
4. Solar panel dead load = approximately 3.0 psf.
5. ASCE 7-10.
6. OSB shall be 24/16 APA rated sheathing minimum (7/16" thick).
7. Plywood shall be 32/16 APA rated sheathing minimum (15/32" thick).
8. Sheathing shall be free of defects including, but not limited to water damage and delamination.
9. Roof rafters or trusses spaced at 24" on center maximum.
10. PV panels must be supported per the manufacturer's required orientation, location and/or spacing.
11. Through a maximum of 2 layers of composite asphalt roof shingles or maximum 20 gage metal decking provided the metal is predrilled as wood screws are not designed to penetrate the metal decking. Not valid on concrete roof tile.
12. The tables show the minimum number of mounts required to support each panel. 4 & 6 refer to 4 mounts or 6 mounts positively attached to each panel. 6\* indicates the need for 4 mounts which are attached to the panel and 2 mounts located at the panel midpoint to support downward compression loads only. These two compression only mounts are not required to be attached to the panels.

**'Rail Option':**

The 'Rail Option' consists of the Roof Tech RT-[E] Mount base attached to the roof structure in the same manner as the standard rail-less installation using SS304 5.0 mm x 60 mm wood screws. An appropriately load rated 'L-Foot', by others, shall be attached to the [E] Mount base with a stainless steel SS304 8.0 mm bolt, nut, and star conical washer. An appropriately load rated rail, by others, shall be attached to the 'L-Foot' per the rail manufacturer's installation instructions. The RT-[E] Mount may only be installed with the long direction parallel to the roof framing.

For the 'Rail Option' the lateral loads have been reduced by a ratio of 2.165 inches / 5 inches for OSB/Plywood Only installation options and 2.165 inches / 7 inches for the Rafter installation option, which is the maximum allowable height ratio for the 'Rail Option'. The maximum height for the 'Rail Option' is measured from the bottom of the [E] Mount base to the top of the rail. See Exhibit 'B' – attached, for the allowable 'Rail Option' PV panel layouts and 'L-Foot' and rail configuration. The maximum rail cantilever shall be limited to the smaller of 40% of the maximum rail span in the 'Rail Option' tables below and the rail manufacturer's specified maximum cantilever. It is the responsibility of the contractor to verify that the 'L-Foot' and rails that are used have a span rating greater than that shown in the 'Rail Option' tables below. Provide thermal expansion splices along the rail at intervals not to exceed 11 feet and refer to the rail manufacturer's thermal expansion splice detailing for proper installation.

For the 'Rail Option' the maximum allowable uplift and shear force for 7/16" thick sheathing over a 2x4 DF #2 rafter is 586 lb and 139 lb respectively. The maximum allowable uplift, down force and shear force for 7/16" thick OSB only is 141 lb, 236 lb, and 82 lb respectively. The maximum allowable uplift, down force and shear force for 15/32" thick plywood only is 151 lb, 227 lb, and 67 lb respectively.

The attached 'Rail Option' tables below show the maximum [E] Mount spacing in feet that the mounts can safely support for the shown wind speed, wind exposure, roof zone, roof angle, and snow loads which produce reaction loads below the allowable loads listed above.

Table Notes for Tables R1 to R9 – Tabulated values are based on the following criteria:

1. Building mean roof height = 30 ft maximum.
2. Risk Category = II.
3. Solar panel maximum width = 40 in for Landscape, 68 in for Portrait 60 Cell & 77.5 in for Portrait 72 Cell.
4. Solar panel & rail dead load = approximately 4.0 psf.
5. ASCE 7-10.
6. OSB shall be 24/16 APA rated sheathing minimum (7/16" thick).
7. Plywood shall be 32/16 APA rated sheathing minimum (15/32" thick).
8. Sheathing shall be free of defects including, but not limited to water damage and delamination.
9. Roof rafters or trusses spaced at 24" on center maximum.
10. PV panels must be supported per the manufacturer's required orientation, location and/or spacing.
11. Through a maximum of 2 layers of composite asphalt roof shingles or maximum 20 gage metal decking provided the metal is predrilled as wood screws are not designed to penetrate the metal decking. Not valid on concrete roof tile.
12. Maximum height from bottom of base mount to top of rail shall not exceed 5" for the OSB & Plywood only installation options and 7" for the rafter installation option. Ref. Exhibit 'B' detail 2.

Our analysis assumes that the connections and associated hardware are installed in a workmanlike manner in accordance with the RT-[E] Mount Installation Manual and generally accepted standards of construction practice. It is the responsibility of the contractor to verify that the strength of the roof framing meets the minimum properties used in the tests and can safely support the maximum imposed loads stated within this document. Starling Madison Lofquist, Inc. and Roof Tech assume no liability beyond what is specifically shown in this letter. Additional information is available at the Roof Tech web site, <http://www.roof-tech.us/>.

Please feel free to contact me at your convenience if you have any questions.

Respectfully yours,

Tres J. Warner, P.E.  
Design Division Manager

Derek Hanson, P.E.  
Associate/Project Manager

$$7^\circ < \theta \leq 45^\circ$$

$$\theta \leq 7^\circ$$

**DEFINITIONS:**

(REF. ASCE 7-10, FIGURES 30.4-1, 30.4-2A, 30.4-2B, 30.4-2C)

$a$  = 10% OF LEAST HORIZONTAL DIMENSION ( $0.1W$ ) OR  $0.4h$ , WHICHEVER IS SMALLER, BUT NOT LESS THAN 3 FT OR 4% OF LEAST HORIZONTAL DIMENSION ( $0.04W$ ).

$W$  = HORIZONTAL WIDTH OF BUILDING.

$L$  = HORIZONTAL LENGTH OF BUILDING.

$h$  = MEAN ROOF HEIGHT, MEASURED VERTICALLY FROM ADJACENT GRADE, EXCEPT THAT EAVE HEIGHT SHALL BE USED FOR  $\theta \leq 10^\circ$ .

$\theta$  = ANGLE OF PLANE OF ROOF FROM HORIZONTAL IN DEGREES.
